

Vauhkonen J., Matala J., Nikula A. (2023). Future browsing damage in seedling stands according to projected forest resources and moose population density. *Silva Fennica* vol. 57 no. 2 article id 23012. <https://doi.org/10.14214/sf.23012>

**Supplementary file S2.** Factors used to describe forestry dynamics in the applied parameterization of the European Forestry Dynamics Model (EFDM). D – Dynamic, S – Static

Factor # (D/S)	Explanation
1. (D)	Volume in 12 classes based on the NFI data distribution
2. (D)	Age (for even-aged stands) in 26 classes (five-year interval)
3. (D)	Stem number (for uneven-aged stands) in 12 classes based on the NFI data distribution
4. (S)	Geographical region: North / West / East / South
5. (S)	Timber type: Available / Restrictedly available / Damaged wood supply
6. (S)	Forest ownership: Private / Public + other
7. (S)	Site fertility: altogether five categories corresponding to conventional classification
8. (S)	Dominant species: Pine / Spruce / Deciduous trees
